

Dry patch control

BREAKER BioLinks, from Rigby Taylor, is a new water management solution that offers increased curative powers against Dry Patch. Independent research carried out by the STRI in 2009, which included leading wetting agents, showed that Breaker BioLinks, when applied preventatively, reduced the severity of Dry patch, improved turf colour, turf quality and soil moisture content. In addition, it showed that when the rootzone had dried, only Breaker BioLinks improved turf quality and reduced Dry Patch severity. Once in the rootzone, the integrated plant growth phytohormones promote regeneration of damaged root systems and relief from stress.
