

MICROFLOW-CXS RANGE

Slow release liquid fertilizers

WHY MICROFLOW-CXS FERTILIZERS

- › Premium range of controlled or conventional release analyses
- › Analyses can be mixed to give the required release pattern
- › Conventional release is a "true foliar"
- › New high P analysis
- › Improved surfactant to maximise leaf and root uptake
- › Fully compatible with RT Speciality Range and Maintain NT

Methylene Ureas

Long chain molecules are used, which requires microbial action to breakdown, and has minimum scorch risk.

Plant Sugars

The plant sugar content has been increased to give greater longevity from a true foliar fertilizer. These provide an energy source for the mycorrhizae and rhizosphere bacteria, providing the plant with nitrate and phosphate.

Trace Elements

These include, Molybdenum, Boron, Zinc, Manganese, Copper and Iron, to improve plant hardiness, root development and the uptake of macro nutrients.

Advanced penetrants in Microflow-CXS allow the nutrients and biostimulants to move through the soil profile

Microflow-CXS is then quickly taken up by the plant roots

Humates

Humates in Microflow-CXS are derived from Leonardite, a very bioactive form of Humic Acid. This is a highly compressed, natural organic humus that has been further decomposed by microbial organisms. It provides many benefits resulting in improved plant health and growth.
